# HYATTSVILLE BRANCH LIBRARY 

PSU AE Thesis 2019

Ari DiMaria
Lighting/Electrical

## Hyattsville Branch Library

## Building Statistics

Stories: 1 Story Library with 1 Level Parking Garage

Size: 40,258 sqft. Library \& 46,314 sqft. Parking Garage

Cost: \$27,970,244 estimate
Construction Timeline: Not started yet, Goal to start in Spring 2018

## Design \& Construction Team

Owner: Prince George's County Memorial Library System

Architect: Grimm \& Parker
MEP: Weigand Associates
Civil: Adtek Engineers, Inc.
Structural: Restl Designers

## Architecture

- Multi-leveled, metal deck roof
- Terra-cotta, metal panel, and glass curtain facades
- Raised patio above entrance to parking garage

## Lighting

- All LED lighting
- Daylighting from curtain walls and clerestories
- Dimming and occupancy sensors used throughout for energy savings

## Other

- Rooftop PV array
- Green roof system on each side of lower roof.
- Rooftop AC units with DX cooling and VAV fans for distribution

## Executive Summary

In the past libraries, along with many other municipal buildings, have typically been designed in America to be monuments with columns and other architectural feature found in Greek and Roman buildings. The Hyattsville Branch Library is quite the opposite, a brave and innovative modern design that takes advantage of solar power, natural daylighting, free roof space for green rooves, efficient building systems, and new and exciting LED luminaires. Hyattsville Branch Library is a technologically advanced building that has been designed to provide a myriad of public resources for anyone who cares to visit. This report explains how the lighting design in four major areas of the building were redesigned, complete with recommendations and calculations on the practicality of the new design. In addition, parts of the electrical system have been redesigned including the addition of vehicle charging stations and the replacement and relocating of some heater loads in the electrical system. The new heaters chosen have less demand than the previous heaters without compromising their purposes. There were also calculations done to find the possible short circuit voltages and voltage drops of the system as a whole.

## Building Background

Hyattsville Branch Library was designed to not only replace the old library in Hyattsville, Maryland, but to be a public meeting space that is welcoming to all age groups and different types of people. The library will be 40,258 square feet, single story and will have a partially underground, basement parking garage below the library's footprint, that is 46,314 square feet. The library will be surrounded by roads with a drop-off circle on the south side of the building and the entrance to the parking garage on the northwest end of the building. The elevators and stairs to reach the main floor from the parking garage are located on the south side of the garage as to keep the same flow of visitors on the library floor. The project is estimated to cost $\$ 27,970,000$, but has no current construction timeline other than possibly beginning this spring.

Another feature of the Hyattsville Branch Library design is that it has a multileveled metal deck roof with the highest section in the center creating a spine down the center of the building with clerestory windows along the both sides. The roof also has sections dedicated to being green roofs as well as a 40.2 kW photovoltaic array on the west half of the roof. The walls are a combination of terra-cotta bricks, metal panels, and glass curtain facades. There is also planned to be a raised patio above the entrance to the parking garage to the north. The patio contains multiple planters for trees and flowers and overlooks a garden area outside, complete with vegetation and a modern gazebo.

Furniture Floor Plan

## Garage Floor Plan

## Lighting Depth Introduction

The architect, Grimm \& Parker, have the main goal to design the Hyattsville Branch Library as a technologically advanced place that is welcoming to anyone wanting to take advantage of the public resources the library will provide. The main floor is set up in the following way. As people walk or drive up to the southern entrance, they can see a large box of glass which draws people into the vestibule. From there, a hallway from the southern entrance leads along the spine of the building, north, with an area to sit and exits out to the conference rooms, meeting rooms, and offices for the community and library employees. Going north through the main hallway, the occupant will open a door to see the circulation desk immediately to his left. Continuing strait, the visitor will enter a large open room with the main collection and seating area for adults to the right, a children's area to the left, and finally the young adult section nestled in between, near the north wall. On each side (adult and children's area) there is a door on the north façade that allows the visitor to go outside to the patio to relax or look out over the garden.

For my lighting redesign, I focused primarily on the entrance, circulation hallway, children's area, and main collection/seating area. Since there are many ages of people visiting the library it is very important to provide a verity of lighting to support the tasks that will be completed in the space. These tasks include walking through isles looking for a book, sitting/relaxing, reading at chairs and desks, working on computers, studying, and even playing with toys for the specific area for preschoolers. Each of these tasks require different light levels and solutions, which has been tested and calculated using AGi 32 illuminance calculations. In addition to reinforcing the idea of being welcoming to all using lighting, I designed the lighting in the four spaces I focused on to represent the four seasons. Each season evokes specific feelings towards them as well as linking together to mirror the cycles of life. Also, celebrating the seasons is very relevant to Maryland, as the location is such that citizens experience each season almost equally.

## Lighting Area 1 - Entrance

The entrance on the south façade is the main way to get in and out of the library, so it is very important that the area is appealing and attracts pedestrians and drivers alike, during all times of day. Even though libraries are primarily used during the day, with the addition of community meeting rooms and computer labs, it is likely that the library will be open much later in order to continually provide public services. During the day this area needs no additional lighting to support the natural daylighting. In the evening and night however, additional lights have been added to either side of the entrance for the safety of pedestrians approaching the library. The large box of glass, which encloses the vestibule allows for light to spill out onto the sidewalk both providing general illumination right outside and creates a focal point of higher light levels that draws visitors into the library.

The entrance is representative of the spring season because the entrance of a building is the beginning of the occupant's experience with the spaces, just as the spring is the beginning of most life in nature. This concept is further supported by the lighting by having the greatest illuminance coming from the vestibule encouraging visitors to begin their journey into the building. The lower light levels on the paths to the entrance were decided by looking at recommendations in the IES Handbook for covered and not covered entryways with medium activity, since the library will be built next to an existing shopping center with a decent amount of traffic.

Image created by Grimm \& Parker

## Lighting Area 2 - Children's Area / Preschool Play Area

The children's area of Hyattsville Branch Library is located to the west of the center of the building and part of the large open area that contains all of the library stacks, except for the local history books, which have their own room. The south end of the children's area has computer desks and tables to sit, which provides a place for parents and children to read, relax, or work on the computers. In the south west corner is a partially enclosed raised area which is labeled the preschool play area with toys and games for children to play with. The book stacks in the space are spread out and seem to circle another raised area with toy houses that children can explore and play in as well as sit in to read, for older children. Finally, to the north of the area there are three private study rooms and a door out to the patio. A verity of general illumination provided by pendants as well as task lighting is used to provide appropriate light levels for the wide assortment of tasks that will take place in the area from playing with toys to working on the computers. Also, like the other areas with book stacks, a stack luminaire is used to provide illuminance directly onto the sides of the books to make it easy to find the book one is looking for. Additional illuminance is provided by natural light from windows on the west façade and a curtain wall on the north façade. Although the luminaires have been changed from the original design, there will still be controls in place to dim the pendant luminaires that will be close enough to the windows in order to maintain fairly constant light levels at different times of the day.

The children's area represents the summer, since childhood is the next stage of life after birth and the summer also comes after the spring. In nature, summer is the time for growth and reflection, so the fixtures for the space were chosen to both look natural and create a nonuniform wash of light over the space, which is representative of light spilling through the trees in the woods. In addition, the pendants of various geometric shapes are included to provide this uneven light as well as encourage education in children who are learning their shapes, which is another source of growth. In the preschool play area and raised platform with the toy houses, it is more important to have an even distribution of light as to keep children safe while playing by properly illuminating anything that could be tripped over or ran into.

## Lighting Area 3 - Young Adult's Area / Circulation

This space is twelve feet wide an extends from the vestibule, all the way to the young adult section at the northernmost part of the library. After entering the building, a visitor goes strait past the offices and conference rooms to a door that leads into the large open collection area. Then this space (characterized by the high roof that extends al the way through the space) extends through the center of the open area, splitting the room into the children's and adult's area. Immediately after entering the open space, a visitor may stop at the circulation desk to ask questions, which is also on the way out when he is ready to rent a book. The circulation desk also, acts as a focal point to draw attention, because more illuminance is required on the circulation desk than the general lighting which allows visitors to find it easily. The purpose of most of the space is as a transitional space, which only needs general lighting and is supported during the day by clerestory windows that stretch along the entirety of this space on both sides. Additional general illumination is provided by pendants and set to dim down when the amount of natural light can contribute to the overall light levels. On the north side of this space however, there is the young adult section. Although smaller than the children's and adult's area, the are similar tasks that take place, such as looking at stacks, sitting to work or read at tables, and using computers. There is also a large curtain wall on the north end of the space allowing natural light to come in as well as a view to the patio and garden outside.

The young adult / circulation area represents the fall in two ways. The fall is a time where the leaves on the trees are changing and the animals prepare for the coming winter. This is mirrored in the changing nature of the point in a teen's life where they are between childhood and adulthood. Also, this space must be traveled through physically in the library to get to each collection area, which also represents the transitions from one season to the next. To further support my theme, I selected luminaires that had a dynamic feel to them or were irregular in shape.

## Lighting Area 4 - Main Collection / Seating Area

The Main Collection and Seating Area is the largest section of the large open space, which is to the east of the transitional space. The stacks in this space are in parallel groups of lines which are separated by groups of tables for sitting and desks for using the computers. Like the other collection areas, there are stack luminaires illuminating the books directly while additional general illumination is provided by pendants hanging from the ceiling. In areas with table and chairs, more task lighting is provided for visitors who want to relax and read. Again, a large curtain wall on the north side of the space provides indirect daylight into the space as well as a view and door to the patio. Also, there are skylights and windows facing east which will create areas that are very well naturally lit in the morning. The general illumination from the windows and supporting pendants will create a public feel with uniform illuminance. This public feel is very good at strengthening the architect's vision of being hospitable to all kinds of people, especially since if a visitor needs more privacy, they are welcome to use the more private feeling study rooms in the north west corner of the space.

The main collection/seating area is meant to represent the winter. This is the logical season to represent this space as it is connected to the children's area by the young adult section and the winter comes after the fall. The general illumination of the space along with reflective light surfaces is not unlike the look from light bouncing off the snow in the winter. The large amount of daylight that enters the space is a cooler light source by nature which mirrors the feeling of the winter sun and some luminaires were also chosen to sparkle, like ice reflecting the sunlight.

## Electrical Depths Introduction

## The Electrical Distribution System

The electricity for the building is supplied from a utility transformer that provides $480 / 277 \mathrm{~V}$ electricity to the building. There is also a standby generator and PV array that are connected to the electrical system by automatic transfer switches that switch between utility power and one of the alternative sources. After an ATS, wiring goes to branch panels that are $480 / 277 \mathrm{~V}$ and either connect to loads of that voltage or transformers that drop the voltage to 208/120 for other loads. All electrical devices are UL listed. The electrical system has a surge protection device on the main distribution panel as well as each branch circuit panel. Each branch panel has 42 circuits for bolt on breakers and copper bussing. Most wires in the building are copper and THHN/THWN, minimum 12 gage. Conduit must be at least $3 / 4$ " above grade or 1 " in diameter if below grade. At least one receptacle is present in every space. One receptacle is positioned every 12 feet in open offices and every 30 feet in corridors. Receptacles within 6 feet of plumbing devices or pipes are GFI protected. Charging for electrical vehicles is present in the parking garage, which is also where the standby generator is located.

## Service Entrance Equipment

Ductbank runs along the west side of the building, from the utility pole on the northwest side of the building to the utility transformer. The utility transformer is pad mounted in the southwestern part of the parking lot outside the main entrance to the library. The voltage is dropped to $480 / 277 \mathrm{~V}$ by the transformer and delivered to the main electrical room in the southwestern corner of the building. The 3 groups of $4 \# 600 \mathrm{MCM}$ current carrying conductors with 1 \#3 Ground wire per group, that is delivered to the electrical room is also encased in ductbank that is 4 inches in diameter for each. Once in the building, the conductors go into the main switch board with a 1200A GFI MCB and distributes power to the entire building. The emergency lighting, elevators and other life safety loads are connected to automated transfer switches that receive power from either the MSB (utility) or the generator in the most north room of the basement parking garage. There is also a meter on the MSB that can be monitored by the owner.

## Main Electrical Equipment

The main electrical room is part of the southwest part of the first floor of the building and contains many of the electrical distribution devices. The main switch board as well as two transformers, seven panels, and the solar panel equipment is all in the main electrical room. Another transformer and six panels are contained in a nearby 2-hr fire rated closet that is also on the first floor. A room along the north wall of the first floor, called IT/ELEC ROOM \#118
contains another transformer and three panels. The solar panel array is on the western roof, whereas the utility generator is in the parking lot near the entrance to the south. The rest of the power distribution equipment is in the electrical room on the south side of the basement parking garage, including the generator, three transformers, seven additional panels, and disconnects for elevator control.

## Grounding System

## (Electrical Specifications 270526 and E-5.1 Electrical Riser Diagram)

- Conductors: copper wire or cable insulated for at least 600 V
- Bus: $1 / 4$ " by 4 " in cross section, Predrilled bars of annealed copper
- Bolted connection or exothermic-welded
- Grounding rods: copper-clad $3 / 4$ " by 10 ,
- Bonding jumper between ground and neutral buses
- Ground all transformers, manholes and handholes
- Ground water service pipe and gas piping and metal air ducts and structural steel (grounding ring)

## Emergency Power Systems

Article 700 and 701 of the NEC defines emergency power and requires loads such as exit signs, egress lighting, elevator lighting and controls, fire alarm systems, fire pumps, vital HVAC and fire suppression systems are required to be on a standby power system. There are more systems that need to be on standby power according to the NEC that are not present in Hyattsville Library. In the basement parking garage electrical room there is a 250 kW generator that supplies emergency power to the building. The generator is connected as a secondary source of power to three different automatic transfer switches, the primary power source being from the utility. ATS-ELV connects to the elevator motors keeping them operational in an emergency. ATS-LS controls power going to P-LS, which has emergency lighting loads and ATS-PE is connected to some lighting, some HVAC units, and a transformer that provides 120 V power to receptacles and some office appliances. These receptacles and office appliances were chosen by the owner as optional standby and will still be operational during loss of power from the utility.

## Electrical Depth 1 - Electric Vehicle Charging

The electrical plans for the basement parking garage were completed by a different MEP company other than the primary. Because of this, there are some inconsistencies in the amount of detail given for panelboard schedules and plans. For example, panel PGB in the basement electric room had three existing electric vehicle charging stations in the schedule, but no indication of the company and model of the charger. In addition, it appeared as though the load was simply estimated on the schedule instead of being based on a real-world charger. To fix this oversight, I took it upon myself to find a new model of dual-tech electric vehicle charging that used less volt-amps than the previous chargers. Also, I decided to place five dual chargers in the parking garage, because out of one hundred parking spots, it is very possible that at least five visitors will use electric cars. In addition, the presence of more chargers will encourage more visitors and employees to drive their electric vehicles to the library, which is ultimately better for the environment. Due to the additional chargers the panelboard would need to be resized, however since the original loads for each of the three chargers required $13,000 \mathrm{VA}$ and the new chargers only require about $9,000 \mathrm{VA}$, the panel and wire sizes are already sufficient to handle the slight overall increase in the load on panel PGB from 50,466 VA to 56,260 VA. Changing panel PGB, n turn increased the load on panel PGA which feeds PGB as well, but alike the previous panel, the increase in load was not enough to warrant a larger panel or thicker wires. The spots with the vehicle chargers will be located on the western side of the parking lot and are the closest spots to the stairs to the main floor except for the handicapped spaces to reward visitors for driving an electric vehicle.

TurboDock Dual Wall Mount

## Electrical Depth 2 - Panel ESP

On the roof there is a 40.2 kW photovoltaic array that feed a panel, ESP, through an ATS switch which is also connected to the utility. Surprisingly, panel ESP had been originally left with only spare circuits, which means the solar panels are not powering anything. I decided that I wanted Panel ESP to be useful in order to take advantage of the inexhaustible source of energy that is the sun and lessen the load on the rest of the electrical system. Since there is no battery storage for the solar array, panel ESP will have to be powered by the utility during times when t is not sunny. Because of this, it is unacceptable to put any load on this panel that could be categorized as an emergency load or even optional standby. I decide to move four heaters to panel ESP, because they were quite big loads that where placed on panel PM-B1, one of the largest panels, with a 350 amp main circuit breaker. Some HVAC devices such as ventilation for the electrical rooms are already present on a standby system and will be powered by the basement generator during the event of power loss. I placed 27,354 VA of heaters on panel ESP that serves areas like toilets and stairs that are not necessary in the event of a power outage, but would be nice for the comfort of the visitor if they could be operational if the power is out during the day. In order to move the heaters from one panel to another, I had to find different devices, because panel ESP is $277 / 480$ V, while the original panel PM-B1 was $120 / 208$ V. Also, with the removal of loads from panel PM-B1, the panel PM-A was also had its load reduced since it feeds panel PM-B1.

Section of single-line diagram found in appendix B

## Mechanical Breadth - Heater Replacement

By finding alternate devices for the mechanical system it is possible to reduce the demand loads, while keeping the same performance. Since I wanted to reduce the loads by as much as possible, I chose to find viable replacements for some of the heaters, because they have a very high demand per device. I decided to remove one AWH-A (QMARK AWH45083) and three UH-A (QMARK MUH-07-8) from panel PM-B1 which is $120 / 208$ V. I decided to replace them with the 480 V equivalences EHA-AK9E and QMARK MUH-07-4 respectively, because with a higher voltage the demand in amps was less for these new devices. It was very important that the new heaters had the same BTUH as the original so that the performance of the mechanical system would not be affected. Device AWH45083 and EHA-AK9E both have 16400 BTUH and MUH-07-8 and MUH-07-4 have 25.6 BTUH. In order to power these new 480 V devices, the loads were placed and balanced on panel E-SP as part of my electrical depth and are powered by an ATS that is connected to both the photovoltaic array and utility MSB. Even though the load on panel PM-B1 went from 288 amps to 193 amps (a saving of 95 amps ), the four new devices were able to fit on panel E-SP which only has a circuit breaker that can hold 50 amps . Only 33 amps were placed on this panel after the replacement, so I saved a total of 62 amps of load that will no longer be needed in the system.

## Voltage Drop

## Assumptions / Constants

- Copper wires with magnetic conduit
- 0.9 power factor
- 0.577 multiplier for three-phase, line to neutral

## MSB>ATS-PE

- $277 / 480 \mathrm{~V}$
- 226 A
- 600 kcmil
- 62.5 ft
$\mathrm{VD}=\underline{(0.71)(0.577)(62.5)(226)}=0.579 \mathrm{~V}$ 10000
$\mathrm{VD} \%=\underline{0.579} \times 100 \%=0.12 \%$

## ATS-PE>PE-1

- $277 / 480 \mathrm{~V}$
- 226 A
- 600 kcmil
- 15.5 ft

$$
\begin{aligned}
& \mathrm{VD}=\frac{(0.71)(0.577)(15.5)(226)}{10000}=0.144 \mathrm{~V} \\
& \mathrm{VD} \%=\frac{0.114}{480} \times 100 \%=0.03 \%
\end{aligned}
$$

## PE-1>LG-EM

- $277 / 480 \mathrm{~V}$
- 33 A
- 3 AWG
- 72 ft
$\mathrm{VD}=\frac{(4.4)(0.577)(72)(226)}{10000}=0.603 \mathrm{~V}$
$\mathrm{VD} \%=\frac{0.603}{480} \times 100 \%=0.13 \%$

## LG-EM>TGP-EM

- $277 / 480 \mathrm{~V}$
- 64 A
- 4 AWG
- 3 ft
$\mathrm{VD}=\underline{(5.3)(0.577)(3)(64)}=0.059 \mathrm{~V}$
10000
$\mathrm{VD} \%=\underline{0.059} \times 100 \%=0.01 \%$
480

TG-EM>PEM

- $120 / 208 \mathrm{~V}$
- 64 A
- 3 AWG
- 3 ft
$\mathrm{VD}=\underline{(4.4)(0.577)(3)(64)}=0.049 \mathrm{~V}$ 10000
$\mathrm{VD} \%=\underline{0.049} \times 100 \%=0.01 \%$
480
$\mathrm{VD}_{\text {total }}=1.434 \mathrm{~V}$
$\mathrm{VD} \%_{\text {total }}=0.3 \%<5 \%$ Code

Table 3-12- Three-phase line-to-line voltage drop for 600 V single-conductor cable
per 10000 A -ft $\left(60^{\circ} \mathrm{C}\right.$ conductor temperature, 60 Hz$)$

Description:
Stack | 117
WingRail

Stack | 117, Single-sided WingRail, with 18" arm (457mm) and Stack mounted

WingRail
Asymmetric profile, 1.14 ? ( 29 mm ) x 2.12 ? ( 54 mm ).

Arm Length: Arm lengths of single and double-sided MLR Sidekick Systems are measured from the center of the ballast housing to the end of the arm.

Dimming: Dimming curve is factory preset to linear. Logarithmic is available upon request.

ETL listed, dry location

For more information visit:
Resources \& Downloads - https://vode.com/resources-downloads

## GENERAL SPECIFICATION

Body: Aluminum.
Canopy: White powder coated.
Finish: Powder coated.
Suspension: Stainless steel cables.
Power cable: Silver braided.
Drivers: HPF electronic drivers for 120-277V (EU-240V), 0-10V, 1\% dimming.
Remote Mounting Of Drivers: Wire size 18 AWG - max distance (from fixture to drivers) 40', wire size 16 AWG - max distance 60', wire size
14 AWG - max distance 90'. Drivers must be accessible after installation.
Mechanical: Luminaires mount directly over J box (by others - North America only).
Diffusers: Frosted acrylic.
L70 @25deg C: > 50,000 hrs.
Delivered Lumens: Delivered lumens \& LPW based on 3000K (min 80 CRI) for White LEDs only.
Approvals: Damp Location (Indoor use only).

HOW TO ORDER

## SPECIFY LUMINARIE LENGTH

| Code: | Length: | Power (LED): | Light Direction: | Delivered Ims (Length): | LPW: |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 983815 | 610mm/24" | 13W | Direct | 1572 | 119 |
| 983825 | $915 \mathrm{~mm} / 36^{\prime \prime}$ | 20W | Direct | 2356 | 118 |
| 983835 | $1219 \mathrm{~mm} / 48^{\prime \prime}$ | 27W | Direct | 3142 | 118 |
| 983845 | $1524 \mathrm{~mm} / 60$ " | 33W | Direct | 3928 | 118 |
| 983855 | $1803 \mathrm{~mm} / 71^{\prime \prime}$ | 40W | Direct | 4714 | 118 |
| 983865 | 2108mm/83" | 47W | Direct | 5498 | 118 |
| 983915 | $610 \mathrm{~mm} / 24^{\prime \prime}$ | 27W | Direct/Indirect | 3196 | 120 |
| 983925 | $915 \mathrm{~mm} / 36{ }^{\text {" }}$ | 40W | Direct/Indirect | 4794 | 120 |
| 983935 | $1219 \mathrm{~mm} / 48^{\prime \prime}$ | 53W | Direct/Indirect | 6392 | 120 |
| 983945 | $1524 \mathrm{~mm} / 60$ " | 66W | Direct/Indirect | 7990 | 120 |
| 983955 | $1804 \mathrm{~mm} / 71^{\prime \prime}$ | 80W | Direct/Indirect | 9588 | 120 |
| 983965 | 2108mm/83" | 93W | Direct/Indirect | 11186 | 120 |

## Additional Information

Calculate total lumens and wattage by adding the Length lumens to the Width lumens. For example: direct only $36^{\prime \prime}$ length $\times 48^{\prime \prime}$ width $=2356+3142=5498$ total lumens.

## SPECIFY WIDTH

SI - VERTICAL, REMOTE DRIVER

S3 - VERTICAL, INTEGRAL DRIVER

Direct/Indirect: Available upto $1168 \mathrm{~mm} / 46$ " sq only.

## APPROVALS

$\mathbf{C \in}\left(\frac{\text { DAMP }}{\text { DOM }}\right.$. $\mathcal{F} / \mathbb{P} 20$

## GENERAL SPECIFICATION

## Product Overview:

- Sleek $1^{\prime \prime}(25 \mathrm{~mm})$ profile
- Robust aluminium construction
- High efficiency frosted acrylic diffuser with 123 LPW delivered
- Available in five sizes, three different colour temperatures and multiple finishes including our signature Light Cherry \& Dark Walnut wood grain.
- Larger sizes and multi-tier pendants available for custom order.

Body: Aluminum, Equilateral Triangle
Finish: Powder coated for standard finishes (black, metallic silver \& white). For wood grain finishes the canopy will be white.
Suspension: Stainless steel cables.
Power cable: Silver braided.
Drivers: HPF electronic drivers for 120-277V (EU-240V), 0-10V, 1\% dimming.
Remote Mounting Of Drivers: Wire size 18 AWG - max distance (from fixture to drivers) 40', wire size 16 AWG - max distance 60', wire size 14 AWG - max distance 90'. Drivers must be accessible after installation.
Mechanical: Luminaires mount directly over J box (by others - North America only).
Diffusers: Frosted acrylic.
L70 @25deg C: > 50,000 hrs.
Delivered Lumens: Delivered lumens \& LPW based on 3000K (min 80 CRI) for White LEDs only.
Approvals: Damp Location (Indoor use only).

Power Over Aircraft Cable

## APPROVALS

## GENERAL SPECIFICATION

Body: Aluminum.
Finish: Powder coated for standard finishes (black, metallic silver \& white). For wood grain finishes, the canopy will be white.
Suspension: Stainless steel cables.
Power cable: Silver braided.
Diffuser: Protruding Lens ( $2.1 \mathrm{~mm} / 0.08^{\prime \prime}$ )
Drivers: HPF electronic drivers for 120-277V (EU-240V), 0-10V, 1\% dimming.
Remote Mounting Of Drivers: Wire size 18 AWG - max distance (from fixture to drivers) 40', wire size 16 AWG - max distance 60', wire size 14 AWG - max distance 90'. Drivers must be accessible after installation.

Remote Emergency: Emergency option provides a 1.5 hour (3 hours for EU) emergency lighting facility. The remote system includes the inverter module, NiCad batteries and a remote wall/ceiling LED charge indicator and test switch (NA only) Maximum distance between wall/ceiling plate and luminaire is $4.5 \mathrm{~m} / 15^{\prime}$. Test switch fits a single gang box (not supplied).
Mechanical: Luminaires mount directly over J box (by others - North America only).
L70 @25deg C: > 50,000 hrs.
Delivered Lumens: Delivered lumens \& LPW based on 3000K (min
80 CRI) for White LEDs only.
Approvals: Damp Location (Indoor use only).

## GENERAL SPECIFICATION

Housing: Round metal frame consisting of modules combined together for electrical and mechanical connection. Bubble 3D supplied in the following diameters: 1000 mm (39.4"), 1800mm (70.9") and 2800mm (110.0").

Diffusers: Injection molded, UV stabilized, opal polycarbonate.
Diffusers are sectional with subtle but visible seams. Bubble 1000, 3 diffusers; Bubble 1800, 8 diffusers and Bubble 2800, 16 diffusers.
Drivers: Luminaires supplied with two power supply box included electronic drivers 120/277V, dim 0-10V (10\%). Connection of the power cords (approx 6) to the remote drivers by others.
Power cables: Luminaires, supplied with $13.5 \mathrm{~m} / 35$ ' of cable. Cables can be extended to a maximum overall distance of $20 \mathrm{~m} / 64^{\prime}$. Custom cable lengths can be supplied to special order.

Finish: White RAL 9003.
Delivered Lumens: Delivered lumens \& LPW based on 3000K (min 80 (RI).
Note: Luminaire composed of $1 \times$ Bubble $2800,1 \times$ Bubble 1800 and $1 \times$ Bubble 1000
with suspended cables and canopy. Positions fixed as per drawing (see Dimensional
Diagrams). Triple Circuit.

## GENERAL SPECIFICATION

Body and trim: Steel and aluminum.
Finish: Polyester powder coated. Canopy finishes as specified except for wood grain finishes where the canopy will be supplied white.
Suspension: Stainless steel cables. Recommended minimum distance from ceiling: 305mm/12" for white LEDs and 610mm/24" for colored LEDs (only for direct/indirect).
Power cable: Silver braided.
Diffusers: Opal polycarbonate, supplied in sections.
Drivers: Integral, HPF electronic drivers for 120-277V (EU-240V).
Mechanical: Luminaires mount directly over J box (by others - North America only)
Integral emergency system: Emergency option provides a 1.5 hour (3 hours for EU) emergency lighting facility. The self contained system includes the inverter module, NiCad batteries, LED charge indicator and test switch (NA only). Integral emergency EU luminaires have a $270 \mathrm{~mm} / 10.5^{\prime \prime}$ DIA $\times 48 \mathrm{~mm} / 2^{\prime \prime}$ height canopy with LED charge indicator. Not available with a 347 V supply.
L70 @ $25^{\circ} \mathrm{C}\left(77^{\circ} \mathrm{F}\right): ~>60,000$ hrs.
Delivered lumens: Delivered lumens \& LPW based on 4000K (min 80 CRI) for white LEDs only.
Approvals: Damp Location (Indoor use only).

Fixture Type:

Description
Bruck's European and American Artisan, mouth-blown glass is known throughout the world for its quality and beauty. Several light source options, mounting options, colors and finishes allow for a unique design.

It is offered in matte chrome, chrome or bronze and is compatible with any Bruck line voltage track as well as Halo® single circuit for retrofit. Chrome and matte chrome finish provided with clear cord. Bronze finish provided with black cord. The pendant can be mounted from Bruck's field adjustable 4" Kiss Canopy and accepts GU24(LED/CLF) or medium base lamping options. Standard overall cable length of 59" can be field-cut or specified when ordering.

## Mina Pendant LED

## DESCRIPTION

The Mina pendant light from Tech Lighting features an elegant sphere of pure optic crystal. This beautiful floating orb is laseretched and further illuminated by a powerful downward-firing LED hidden within the socket. Although smaller in diameter, the Mina brilliantly provides a bounty of task light onto surfaces below. Highly customizable, the Mina pendant features 8 cord colors and three on-trend finish options. The Mina ships with your choice of fully dimmable LED lamping. In addition to the wide range of customizable options, the Mina pendant also comes with two complementary accessory options. Swag Hooks and the Locus accessory. Due to its contemporary yet raw style, the Mina can be used in a range of consumer and commercial lighting applications. Includes 9 watt, 135 delivered lumen, $3000 \mathrm{~K}, 2200 \mathrm{~K}$ or $3000 \mathrm{~K}-2200 \mathrm{~K}$ warm-color dimming LED module. Fixture provided with twelve feet of field-cuttable cloth cord. Dimmable with low-voltage electronic or triac dimmer.

## INSTALLATION

This product can mount to either a 4" square electrical box with round plaster ring or an octagon electrical box.

${ }_{6}{ }^{\circ}$

## Features

## Color

- Standard: white, almond, metallic silver, bronze, metallic charcoal, aluminum, semi-gloss black.
- Custom colors available upon request.

## Finish

- Standard: epoxy/polyester powder paint.
- Optional: anodized aluminum.

## Voltage

- 120V, 208V, 240/208V, 277V, 347V, 480V, 600V, 1-phase.

## Construction

- Extruded aluminum front grille, $1 / 8 \mathrm{in}$. ( 3.2 mm ) thick. 1
- Bottom air outlet.
- High-limit temperature control with automatic reset.

## Fan

- Closed, factory-lubricated motor.
- 160 cfm fan (single unit: 55 dBA ); $2 \times 160 \mathrm{cfm}$ fan (double unit: 58 dBA), 3 X 160 cfm fan (triple unit: 61 dBA ). 2
- Fan delay purges heater of residual heat.

## Heating element

- Durable tubular heating element with fins. 3

## Control

- Built-in tamper proof thermostat included. 4
- 24 V relay, with or without transformer available.

Note: Thermostat is not included in heater with factory installed relay. Any remote thermostat or relay must be connected to the heater control terminal block.

## Installation

- Minimum clearance from the floor and adjacent walls: 10 in. (25.4
cm).
- Adaptor for surface mounting available.
- Up to 3 units can be mounted side-by-side

Warranty

- 3-year warranty against defects.

## Application

- Apartment building, commercial building, entrance way, stairwell, garage.

■ BMS-compatible through an optional relay

- Contemporary bar-stock grille designed to provide optimized airflow
- Manual reset thermal overheat protector disconnects power in the event of accidental blockage
- Built-in tamper-reisistant thermostat
- All units have a permanently lubricated and enclosed fan motor, which creates long life, low maintenance, and gently distributes warmth throughout the area
- Automatic fan delay eliminates cold drafts on start-up and discharges residual heat from the heater body during shut down

■ Power on/off switch for added safety during maintenance

| AWHSM | 685360007243 | Surface mounting frame for surface installations. Painted to match heater decor, 3-13/16 in. deep, Statuary Bronze | 5 |
| LFKSFCNW | 685360160795 | 14-gauge security front cover, Northern White | 6 |

NOTE: * Will accommodate pneumatic/electric or low-voltage controls commonly used with computerized energy management systems Mounting Limitations: For wall mounting, do not install back box closer than 8 in. from floor or adjacent wall. Do not install heater behind towel rack, behind door, in floor, in closet, in ceiling or where air flow may be obstructed. All controls are concealed behind the front cover making them essentially tamper proof.

## CFM

- 350-3000

- Wide range of optional control kits are field-installable, increasing the unit's adaptability to specification market
- Small- to medium-case construction is 20-gauge steel with larger cabinet 18-gauge steel; completely enclosed fan motor
- Advanced pull-through air flow design draws air across heating element for even air distribution and cooler element operation

■ Specially designed venturi outlet to meet required additional air throw in vertical position

- Branch circuit fusing (when required)

■ 2-speed fan selector switch ( 25 to 50 kW models) and optional fan-only switch for air movement with no heat

■ 1- or 3-phase wiring on 5 kW through $10 \mathrm{~kW} 208 / 240 \mathrm{~V}$ and 15 kW 208 V units (field-interchangeable)

- Aluminum-finned, copper-clad steel sheath heating element extends life due to cooler sheath temperature and faster heat dissipation
- 24 V control transformer standard on most models, providing safer and more accurate means of temperature control. 3 kW and 5 kW , 208277 V , have line voltage controls as standard ( 24 V control available on made-to-order basis)
■ Automatic reset linear thermal cut-out, capillary type, provides protection over entire length of element areas (manual reset protection available on made-to-order basis)
- No piping flues, valves or traps needed for installation
- Individual stainless steel adjustable louvers to direct air flow

NOTE: All standard units are supplied with a low voltage control transformer and contactor (24V) except MUH03 and MUH05, 208V, 240 V and 277 V models. Low voltage control on these units is available on made to order. All units are also available on special order for 120 V control; internal with transformer or external without transformer. On dual-voltage units CFM, FPM, \& RPM ratings are listed at higher voltage operation. On dualphase units maximum amp draw is listed for respective voltage. 25 thru 50 KW models having two-speed
motors and dual CFM ratings are listed in Full Line Catalog. 5A. Standard; 5B. Optional - made to order - amp load unbalanced on three-phase; 5C. Optional - made to order - amp load balanced on three-phase.
*Must use two-stage Thermostat on $3 \emptyset$ operation

| M | $9-15 / 16$ | $14-15 / 16$ |
| N | $3-1 / 4$ | $4-1 / 2$ |

MOUNTING LIMITATIONS: Unit heaters should not be used in potentially explosive atmospheres. The finish is not intended for direct salt spray exposure in marine applications or the highly corrosive atmospheres of swimming pools, chemical storage bins, etc. Do not install unit heaters above recommended maximum mounting height. Obstructions must not block unit heater air inlet or discharge. Heaters must be mounted at least 7 ft . above the floor to prevent accidental contact with the heating element or fan blade which could cause injury.

FACTORY-INSTALLED OPTIONS FOR CONTROLS \& ACCESSORIES

| DESCRIPTION |
| :---: |
| MUH03 \& 05 (208, 208/240, 277V Supply) |
| 24 or 120V Control Transformer and Power Contactor |
| 24 or 120V H.C. Power Contactor |
| MUH03 \& 05 (480V Supply) \& MUH07 thru MUH50 |
| Optional 120V Control |
| 2-Stage Control of Elements (See Note 5) |
| Manual Reset |
| Outlet Mesh (Bird Screen) For all MUH Heaters |

NOTE: Any factory-installed options require added surcharge. See price book for charges or contact factory.

## ABET Paragraphs

## Impact on architectural features and other building systems and construction processes

The main way that lighting can support the architecture of a space is through indirect lighting. In my lighting redesign, I used many direct/indirect pendants as well as wall grazers that can illuminate a surface as opposed to illuminating the occupant directly. This not only draws attention to the forms of the architecture but provides diffuse lighting that is easy on the eyes, without the possibility of glare. By redesigning the lighting system, it is also important to avoid the intersection of wiring and device from other systems in the roof plenum, such as electrical wiring or mechanical ducts. If the new luminaires are not all the same voltage, additional panels or converters will also be necessary on the electrical side to support the variety. When redesigning the electrical system, it is important to balance all loads on a panel to minimize current on the neutral. Along with this, any changes to the lighting or mechanical devices will affect the panel loads and in turn could call for a larger panel or wire sizes. As always. Any change to building systems may cause an increase in construction cost or time, even if the changes that have been made might save money in the long run.

## How does my proposed design consider public health, safety, welfare, and sustainability factors?

The electrical system in Hyattsville Library has been designed with a generator in the basement that provides power to many panels in the building through multiple ATS, during the event of lost power from the utility. The devices on emergency power include fire alarms, some lighting, controls for the elevators, ventilation in electrical rooms and elevators. These devices help the occupants to be safe and comfortable in the event of an emergency and most importantly help the visitor to exit the library. Part of my mechanical breadth was to replace four heaters with new ones that not only need less load, but they were moved to a panel powered by a solar panel array, saving a lot of energy during the day. In addition to a 40.2 kW photovoltaic array on the roof, there is a green roof on a large section of the low roof of the library. The green roof helps with sustainability by improving stormwater management, minimizing the heat island effect, and reducing noise and air pollution.

[^0]:    http://www.reznorhvac.com/files/805e.pdf

[^1]:    'Solid conductor. Other conductors are stranded.

[^2]:    ${ }^{1}$ Units with Option AK3E (240V supply voltage) can be connected to 208 V power supply, but heating output will be reduced by $25 \%$.
    ${ }^{2}$ Built-in transformer is not included with 24 V control voltage (Option BT1).
    ${ }^{3}$ For the U.S. only: The nominal current of the unit must not exceed $80 \%$ of the capacity of the disconnect.
